OW 2023 - N2

## Regis Barbosa

## Part 1

Theorem 1 (Chord Theorem - "Power of a Point"). Let $\Gamma$ be a circle, and $P$ a point. Let a line through $P$ meet $\Gamma$ at points $A$ and $B$, and let another line through $P$ meet $\Gamma$ at points $C$ and $D$. Then

$$
P A \cdot P B=P C \cdot P D
$$

If $P$ lies outside $\Gamma$ and we draw $P T$ tangent to $\Gamma$ at $T$, then

$$
P A \cdot P B=P C \cdot P D=P T^{2}
$$

## Proof.

For the first case, we have $\angle P D A=\angle P B C(\operatorname{arc} A C)$ and $\angle D P A=\angle B P C$ (opposite at $P)$. So $\triangle P D A \sim \triangle P B C(A A)$ and

$$
\frac{P A}{P C}=\frac{P D}{P B} \Leftrightarrow P A \cdot P B=P C \cdot P D
$$

In the second case, we also have $\triangle P D A \sim \triangle P B C(A A)$ and $P A \cdot P B=P C \cdot P D$.
For the other part we have $\angle P D T=\angle P T C \quad$ (arc $C T), \quad \angle D P T=\angle T P C \quad$ and $\triangle P D T \sim \triangle P T C(A A)$. The ratio of the sides gives us

$$
\frac{P T}{P C}=\frac{P D}{P T} \Leftrightarrow P T^{2}=P C \cdot P D
$$

Theorem 2 (Converse to power of a point). Let $A, B, C, D$ be four distinct points. Let lines $A B$ and $C D$ intersect at $P$. Assume that either
(1) $P$ lies on both line segments $A B$ and $C D$, or
(2) $P$ lies on neither line segments.

Then $A, B, C, D$ are concyclic if and only if $P A \cdot P B=P C \cdot P D$
Proof.
Suppose that $P$ lies on both line segments $A B$ and $C D$. We have $\angle D P A=\angle B P C$ (opposite at $P$ ) and

$$
P A \cdot P B=P C \cdot P D \Leftrightarrow \frac{P A}{P C}=\frac{P D}{P B} \Leftrightarrow \triangle P D A \sim \triangle P B C \Leftrightarrow \angle P D A=\angle P B C
$$

This occur iff $A, B, C, D$ are concyclic.
Case (2) is analogous.

## Problems

1. (AMC/2020-12B) In unit square $A B C D$ the inscribed circle $\omega$ intersects $C D$ at $M$ and $A M$ intersects $\omega$ at a point $P$ different from $M$. What is $A P$ ?
(A) $\frac{\sqrt{5}}{12}$
(B) $\frac{\sqrt{5}}{10}$
(C) $\frac{\sqrt{5}}{9}$
(D) $\frac{\sqrt{5}}{8}$
(E) $\frac{2 \sqrt{5}}{15}$
2. (AIME I/2019) In convex quadrilateral $K L M N$ side $M N$ is perpendicular to diagonal $K M$, side $K L$ is perpendicular to diagonal $L N, M N=65$, and $K L=28$. The line through $L$ perpendicular to side $K N$ intersects diagonal $K M$ at $O$ with $K O=8$. Find $M O$.
3. (Brazil/2013) Let $\Gamma$ be a circle and $A$ a point outside $\Gamma$. The tangent lines to $\Gamma$ through $A$ touch $\Gamma$ at $B$ and $C$. Let $M$ be the midpoint of $A B$. The segment $M C$ meets $\Gamma$ again at $D$ and the line $A D$ meets $\Gamma$ again at $E$. Given that $A B=a, B C=b$, compute $C E$ in terms of $a$ and $b$.
4. (USAMO/1998) Let $C_{1}$ and $C_{2}$ be concentric circles, with $C_{2}$ in the interior of $C_{1}$. Let $A$ be a point on $C_{1}$ and $B$ a point on $C_{2}$ such that $A B$ is tangent to $C_{2}$. Let $C$ be the second point of intersection of $A B$ and $C_{1}$, and let $D$ be the midpoint of $A B$. A line passing through $A$ intersects $C_{2}$ at $E$ and $F$ in such a way that the perpendicular bisectors of $D E$ and $C F$ intersect at a point $M$ on $A B$. Find, with proof, the ratio $A M / M C$.
5. (Russia/2012) Consider the parallelogram $A B C D$ with obtuse angle $A$. Let $H$ be the foot of perpendicular from $A$ to the side $B C$. The median from $C$ in triangle $A B C$ meets the circumcircle of triangle $A B C$ at the point $K$. Prove that points $K, H, C$ and $D$ lie on the same circle.
6. (IMO 2000) Two circles $\Gamma_{1}$ and $\Gamma_{2}$ intersect at $M$ and $N$. Let $\ell$ be the common tangent to $\Gamma_{1}$ and $\Gamma_{2}$ so that $M$ is closer to $\ell$ than $N$ is. Let $\ell$ touch $\Gamma_{1}$ at $A$ and $\Gamma_{2}$ at $B$. Let the line through $M$ parallel to $\ell$ meet the circle $\Gamma_{1}$ again at $C$ and the circle $\Gamma_{2}$ again at $D$. Lines $C A$ and $D B$ meet at $E$; lines $A N$ and $C D$ meet at $P ;$ lines $B N$ and $C D$ meet at $Q$. Show that $E P=E Q$.

## Part 2

Definition (Power of a Point) The power of a point $P$ with respect to a circle $\Gamma$ of center $O$ and radius $r$ is defined by

$$
\operatorname{Pot}_{\Gamma} P=P O^{2}-r^{2}
$$

Theorem 3. If $P$ is inside the circle $\Gamma$ and a line through $P$ cuts $\Gamma$ at $A$ and $B$, then

$$
P A \cdot P B=-\operatorname{Pot}_{\Gamma} P
$$

If $P$ is outside the circle $\Gamma$, a line through $P$ cuts $\Gamma$ at $A$ and $B$ and a line through $P$ is tangent to $\Gamma$ at $T$, then

$$
P A \cdot P B=P T^{2}=P o t_{\Gamma} P
$$

## Proof.

The line $O P$ cross the circle on points $E$ and $F$.
On the first case we have $P E=r+P O$ and $P F=r-P O$. By the Chrod Theorem

$$
P A \cdot P B=P E \cdot P F=(r+P O)(r-P O)=r^{2}-P O^{2}=-P o t_{\Gamma} P
$$

The second case is analogous.

## Problems

7. (AMC/2013-10A) In $\triangle A B C, A B=86$, and $A C=97$. A circle with center $A$ and radius $A B$ intersects $B C$ at points $B$ and $X$. Moreover $B X$ and $C X$ have integer lengths. What is $B C$ ?
(A) 11
(B) 28
(C) 33
(D) 61
(E) 72
8. (AIME I/2019) Let $A B$ be a chord of a circle $\omega$, and let $P$ be a point on the chord $A B$. Circle $\omega_{1}$ passes through $A$ and $P$ and is internally tangent to $\omega$. Circle $\omega_{2}$ passes through $B$ and $P$ and is internally tangent to $\omega$. Circles $\omega_{1}$ and $\omega_{2}$ intersect at points $P$ and $Q$. Line $P Q$ intersects $\omega$ at $X$ and $Y$. Assume that $A P=5, P B=3, X Y=11$, and $P Q^{2}=\frac{m}{n}$, where $m$ and $n$ are relatively prime positive integers. Find $m+n$.
9. (Euler's relation) In a triangle with circumcenter $O$, incenter $I$, circumradius $R$, and inradius $r$, prove that

$$
O I^{2}=R^{2}-2 R r
$$

10. (Tuymaada/2012) Point $P$ is taken in the interior of the triangle $A B C$, so that

$$
\angle P A B=\angle P C B=\frac{1}{4}(\angle A+\angle C)
$$

Let $L$ be the foot of the angle bisector of $\angle B$. The line $P L$ meets the circumcircle of $\triangle A P C$ at point $Q$. Prove that $Q B$ is the angle bisector of $\angle A Q C$.
11. (China/2013) Two circles $K_{1}$ and $K_{2}$ of different radii intersect at two points $A$ and $B$, let $C$ and $D$ be two points on $K_{1}$ and $K_{2}$, respectively, such that $A$ is the midpoint of the segment $C D$. The extension of $D B$ meets $K_{1}$ at another point $E$, the extension of $C B$ meets $K_{2}$ at another point $F$. Let $l_{1}$ and $l_{2}$ be the perpendicular bisectors of $C D$ and $E F$, respectively.
i) Show that $l_{1}$ and $l_{2}$ have a unique common point (denoted by $P$ ).
ii) Prove that the lengths of $C A, A P$ and $P E$ are the side lengths of a right triangle.
12. (IMO Shortlist/2011) Let $A_{1} A_{2} A_{3} A_{4}$ be a non-cyclic quadrilateral. Let $O_{1}$ and $r_{1}$ be the circumcenter and the circumradius of the triangle $A_{2} A_{3} A_{4}$. Define $O_{2}, O_{3}, O_{4}$ and $r_{2}, r_{3}, r_{4}$ in a similar way. Prove that

$$
\frac{1}{O_{1} A_{1}^{2}-r_{1}^{2}}+\frac{1}{O_{2} A_{2}^{2}-r_{2}^{2}}+\frac{1}{O_{3} A_{3}^{2}-r_{3}^{2}}+\frac{1}{O_{4} A_{4}^{2}-r_{4}^{2}}=0
$$

## Part 3

Theorem 4. (Radical Axis) Given two circles $\Gamma_{1}$ and $\Gamma_{2}$ with different centers, the locus of the points $P$ on the plane such that the power of $P$ with respect to $\Gamma_{1}$ is equal the power of $P$ with respect to $\Gamma_{2}\left(\operatorname{Pot}_{\Gamma_{1}} P=\operatorname{Pot}_{\Gamma_{2}} P\right)$ is a line perpendicular to the line through the centers of $\Gamma_{1}$ and $\Gamma_{2}$.

Proof. Let $O_{1}$ and $r_{1}$ be the center and the radius of $\Gamma_{1}$ and $O_{2}$ and $r_{2}$ be the center and the radius of $\Gamma_{2}$. Consider Cartesian coordinates where $O_{1}(0,0)$ and $O_{2}(k, 0)$ with $k \neq 0$ because the circles are non-concentric.

The point $P(x, y)$ have the same power when

$$
\begin{gathered}
\operatorname{Pot}_{\Gamma_{1}} P=\operatorname{Pot}_{\Gamma_{2}} P \Leftrightarrow P O_{1}^{2}-r_{1}^{2}=P O_{2}^{2}-r_{2}^{2} \\
\Leftrightarrow x^{2}+y^{2}-r_{1}^{2}=(x-k)^{2}+y^{2}-r_{2}^{2} \Leftrightarrow-r_{1}^{2}=-2 k x+k^{2}-r_{2}^{2} \\
\Leftrightarrow 2 k x=k^{2}+r_{1}^{2}-r_{2}^{2} \Leftrightarrow x=\frac{k^{2}+r_{1}^{2}-r_{2}^{2}}{2 k}
\end{gathered}
$$

As $x$ has a fixed value, we conclude that the points lie on a line perpendicular to the $x$ axis.

## Problems

13. Let $\omega$ and $\gamma$ be two circles intersecting at $P$ and $Q$. Let their common external tangent touch $\omega$ at A and $\gamma$ at B . Prove that $P Q$ passes through the midpoint $M$ of $A B$.
14. (USAMO/2009) Given circles $\omega_{1}$ and $\omega_{1}$ intersecting at points $X$ and $Y$, let $\ell_{1}$ be a line through the center of $\omega_{1}$ intersecting $\omega_{2}$ at points $P$ and $Q$ and let $\ell_{2}$ be a line through the center of $\omega_{2}$ intersecting $\omega_{1}$ at points $R$ and $S$. Prove that if $P, Q, R$ and $S$ lie on a circle then the center of this circle lies on line $X Y$.
15. (Russia/2014) A trapezoid $A B C D$ with bases $A B$ and $C D$ is inscribed into circle $\Omega$. A circle $\omega$ passes through the point $C$ and $D$, and intersects the segments $C A$ and $C B$ at $A_{1} \neq C$ and $B_{1} \neq D$, respectively. The points $A_{2}$ and $B_{2}$ are symmetric to $A_{1}$ and $B_{1}$ with respect to the midpoints of $C A$ and $C B$, respectively. Prove that the points $A, B, A_{2}$ and $B_{2}$ are concyclic.
16. (AIME II/2019) In acute triangle $A B C$ points $P$ and $Q$ are the feet of the perpendiculars from $C$ to $A B$ and from $B$ to $A C$, respectively. Line $P Q$ intersects the circumcircle of $\triangle A B C$ in two distinct points, $X$ and $Y$ and. Suppose $X P=10, P Q=25$, and $Q Y=15$. The value of $A B$. $A C$ can be written in the form $m \sqrt{n}$ where $m$ and $n$ are positive integers, and $n$ is not divisible by the square of any prime. Find $m+n$.
17. (Japan/2011) Let $A B C$ be a given acute triangle and let $M$ be the midpoint of $B C$. Draw the perpendicular $H P$ from the orthocenter $H$ of $A B C$ to $A M$. Show that $A M \cdot P M=B M^{2}$.
18. (Iran TST/2011) In acute triangle $A B C$ angle $B$ is greater than angle $C$. Let $M$ is midpoint of $B C$. Let $D$ and $E$ are the feet of the altitude from $C$ and $B$, respectively. Let $K$ and $L$ are midpoint of $M E$ and $M D$, respectively. If $K L$ intersect the line through $A$ parallel to $B C$ in $T$, prove that $T A=T M$.
19. (IMO Shortlist/1995) $A B C$ is a triangle. A circle through $B$ and $C$ meets the side $A B$ again at $C^{\prime}$ and meets the side $A C$ again at $B^{\prime}$. Let $H$ be the orthocenter of $A B C$ and $H^{\prime}$ the orthocenter of $A B^{\prime} C^{\prime}$. Show that the lines $B B^{\prime}, C C^{\prime}$ and $H H^{\prime}$ are concurrent.
20. (IMO/2013) Let $A B C$ be an acute-angled triangle with orthocentre $H$, and let $W$ be a point on the side $B C$, lying strictly between $B$ and $C$. The points $M$ and $N$ are the feet of the altitudes from $B$ and $C$, respectively. Denote by $\omega_{1}$ the circumcircle of $B W N$, and let $X$ be the point on $\omega_{1}$ such that $W X$ is a diameter of $\omega_{1}$. Analogously, denote by $\omega_{2}$ the circumcircle of $C W M$, and let $Y$ be the point on $\omega_{2}$ such that $W Y$ is a diameter of $\omega_{2}$. Prove that $X, Y$ and $H$ are collinear.

## Part 4

Theorem 5. (Radical Center) Given three circles, no two concentric, the three pairwise radical axes are either concurrent or all parallel. In the last case, the three centers are collinear.

Proof. Let $\Gamma_{1}, \Gamma_{2}$ and $\Gamma_{3}$ be the three circles with centers $O_{1}, O_{2}$ and $O_{3}$ respectively. Let $r_{12}$ be radical axis of $\Gamma_{1}$ and $\Gamma_{2}$ and $r_{23}$ be the radical axis of $\Gamma_{2}$ and $\Gamma_{3}$.
If $r_{12}$ and $r_{23}$ are parallel, then $O_{1} O_{2}$ and $O_{2} O_{3}$ are parallel. The point $O_{2}$ is common and the three centers are collinear. The third radical axis $r_{13}$ is perpendicular to the line through the centers and parallel to the other radical axes.
If $r_{12}$ and $r_{23}$ are not parallel, then they meet at point $C$.

$$
\operatorname{Pot}_{\Gamma_{1}} C=\operatorname{Pot}_{\Gamma_{2}} C=\operatorname{Pot}_{\Gamma_{3}} C \Rightarrow \operatorname{Pot}_{\Gamma_{1}} C=\operatorname{Pot}_{\Gamma_{3}} C \Rightarrow C \in r_{13}
$$

## Problems

21. (USAMO/1997) Let $A B C$ be a triangle. Take points $D, E, F$ on the perpendicular bisectors of $B C, C A, A B$ respectively. Show that the lines through $A, B, C$ perpendicular to $E F, F D, D E$ respectively are concurrent (or parallel).
22. (IberoAmerican/1999) An acute triangle $\triangle A B C$ is inscribed in a circle with center $O$. The altitudes of the triangle are $A D, B E$ and $C F$. The line $E F$ cut the circumference on $P$ and $Q$.
a) Show that $O A$ is perpendicular to $P Q$.
b) If $M$ is the midpoint of $B C$, show that $A P^{2}=2 \cdot A D \cdot O M$.
23. (AIME I/2016) Circles $\omega_{1}$ and $\omega_{2}$ intersect at points $X$ and $Y$. Line $\ell$ is tangent to $\omega_{1}$ and $\omega_{2}$ at $A$ and $B$, respectively, with line $A B$ closer to point $X$ than to $Y$. Circle $\omega$ passes through $A$ and $B$ intersecting $\omega_{1}$ again at $D \neq A$ and intersecting $\omega_{2}$ again at $C \neq B$. The three points $C, Y, D$ are collinear, $X C=67, X Y=47$ and $X D=37$. Find $A B^{2}$.
24. (IMO 1995) Let $A, B, C$ and $D$ be four distinct points on a line, in that order. The circles with diameters $A C$ and $B D$ intersect at $X$ and $Y$. The line $X Y$ meets $B C$ at $Z$. Let $P$ be a point on the line $X Y$ other than $Z$. The line $C P$ intersects the circle with diameter $A C$ at $C$ and $M$, and the line $B P$ intersects the circle with diameter $B D$ at $B$ and $N$. Prove that the lines $A M, D N$, and $X Y$ are concurrent.
25. (IMO Shortlist/2009) Let $A B C$ be a triangle. The incircle of $A B C$ touches the sides $A B$ and $A C$ at the points $Z$ and $Y$, respectively. Let $G$ be the point where the lines $B Y$ and $C Z$ meet, and let $R$ and $S$ be points such that the two quadrilaterals $B C Y R$ and $B C S Z$ are parallelograms. Prove that $G R=G S$.
26. (IMO Shortlist/2011) Let $A B C$ be an acute triangle with circumcircle $\Omega$. Let $B_{0}$ be the midpoint of $A C$ and let $C_{0}$ be the midpoint of $A B$. Let $D$ be the foot of the altitude from $A$, and let $G$ be the centroid of the triangle $A B C$. Let $\omega$ be a circle through $B_{0}$ and $C_{0}$ that is tangent to the circle $\Omega$ at a point $X \neq A$. Prove that the points $D, G$, and $X$ are collinear.

17. Consider the figure. $A D, B E$ and $C F$ are the altitudes. $P, E$ and $F$ are on the circle of diameter $A H$, because $\angle A F H=$ $\angle A E H=\angle A P H=90^{\circ}$.

The quadrilateral $B F E C$ is cyclic and $M$ is its circucmcenter $\left(\angle B F C=\angle B E C=90^{\circ}\right)$. Using the angles of $\triangle A F C$, we have $\angle F C E=\angle F C A=90^{\circ}-A$. By central angle, $\angle F M E=2$. $\angle F C E=180^{\circ}-2 A$. The triangle $F M E$ is isosceles and $\angle M F E=$ $\angle M E F=\frac{180^{\circ}-\angle F M E}{2}=A$. Then $\angle M E F=\angle M F E=A=\angle E A F$, $M E$ and $M F$ are tangent to the circle of diameter $A H$ and by power of a point $M P \cdot M A=M E^{2}=M B^{2}$.

Note: this point $P$ is known as Humpty point.
